

4 THINGS YOU NEED IN A DIGITAL DATALOGGER

FUNCTIONALITY.

Before attaining a temperature monitoring device, knowing how the unit functions is important when trying to meet the main goal of your facility. The purpose of these devices is to notify personnel in case something bad has happened, such as a temperature excursion. Therefore, it is important to know how an alert will be sent. Whether the alert is visual, audible, an email, or a text, a plan should take place immediately afterwards. Another significant aspect is to understand how the download is performed and whether or not the method is ideal for certain practices. The format of data will determine the ease with which personnel can meaningfully analyze data.

RESOURCES.

It is beneficial to learn what type of training is offered for the device along with the included type of customer support. Due to the possibility of an issue arising with the device, it is important to know how online resources and customer services will be able to assist with any issues.

COMPLIANCE.

When in search for an appropriate monitoring device, the most apparent aspect to consider should be compliance. Ensure that the device is in accordance with governing bodies and any state or local policies in effect.

COST.

The cost of device should be noted, but be sure to take notice of all accessories that are meant to be included with the device. If costs of all accessories, such as software and cable, are not taken into account from the beginning, there could be unexpected additional costs. It is important to be aware of calibration costs as well.
